Focus Question

What makes the Komodo dragon an interesting reptile?

Table of Contents

Very Big Lizards	4
Ready for a Fight	6
Hot Home	9
Mealtime!	11
On the Hunt	12
Baby Dragons	13
Jumbo Lizards	15
Glossary	16

How Big Is It?

Very Big Lizards

Komodo dragons are the biggest lizards in the world.

Lizards are **reptiles**.

Snakes, turtles, and alligators are also reptiles.

Komodo dragons can be as long as two big bathtubs.

They are good **hunters** with sharp teeth and claws.

Komodo dragons live in areas with patches of shade.

Male dragons fight each other for females.

Ready for a Fight

Komodo dragons have long, strong bodies.

They use their teeth and claws to get food.

They also use their teeth and claws to fight other dragons.

Komodo dragons have hard **plates**
on their bodies.
The plates protect them.

The bony plates in a dragon's skin make it feel rough.

What Makes a Komodo Dragon a Reptile?

A Komodo dragon has rough black or yellow-gray skin with bony plates.

A Komodo dragon has about sixty sharp teeth for tearing flesh.

A Komodo dragon has a long tail with strong muscles.

A Komodo dragon has a forked tongue.

A Komodo dragon has long, curved claws.

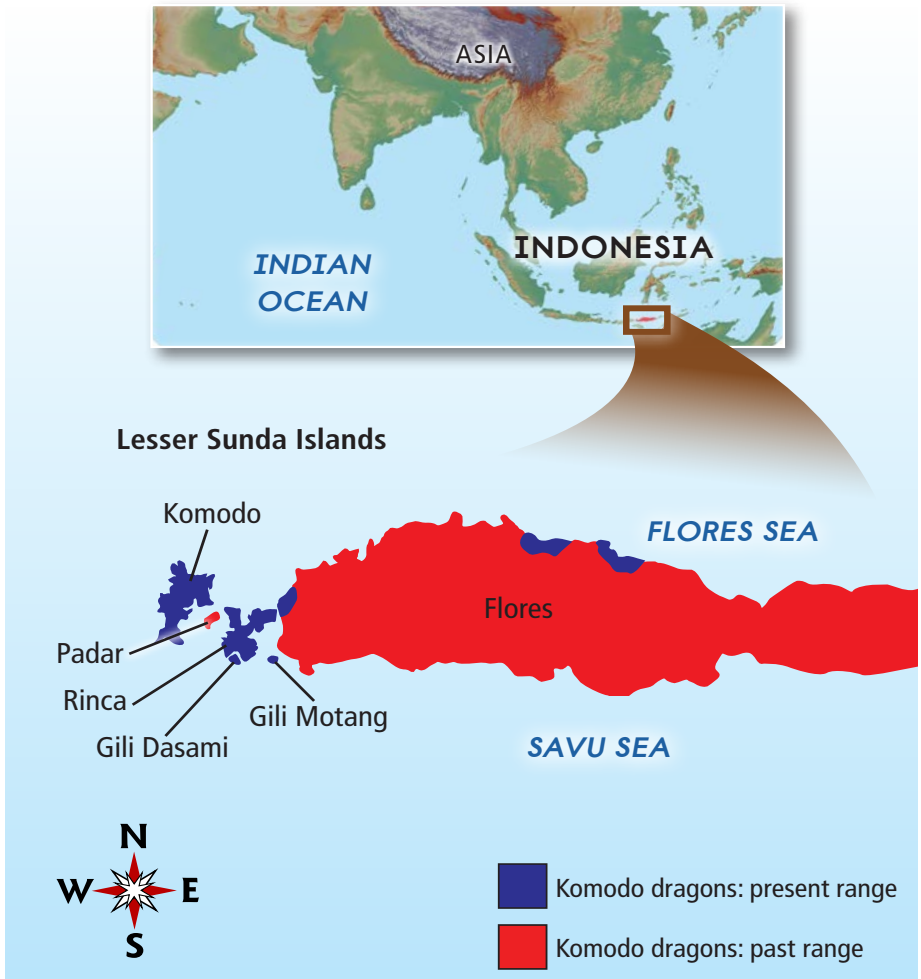

All reptiles

- have a backbone
- have scales or bony plates
- breathe with lungs

Most reptiles

- lay eggs
- are cold-blooded

Where Komodo Dragons Live

Hot Home

Wild Komodo dragons only live in Asia.

They live in forests.

The forests can have
very hot weather.
Komodo dragons stay cool
in **burrows**.

Dragons dig their own
burrow or use another
animal's burrow.

water buffalo

Timor deer

wild pig

Komodo dragons eat many kinds of animals.

Mealtime!

Komodo dragons only eat meat.
Their favorite foods are deer,
wild pigs, and water buffalo.
They also eat young dragons!

On the Hunt

Komodo dragons wait for an animal to pass by.

Then they **attack** with their teeth and claws.

The hurt animal runs away and dies.

Then the dragons use their tongues to find the dead animal.

Many dragons may share a meal.

Baby dragons are a little longer than a ruler when they hatch.

Baby Dragons

Female Komodo dragons lay many eggs in a nest in the ground.

They protect the eggs from other animals.

The eggs **hatch** in six to nine months.

Young dragons in trees eat insects and geckos.

Baby Komodo dragons climb trees to stay safe from adult dragons. They stay there for two years or longer.

Male dragons can live to the age of sixty.

Female dragons live about half as long.

Jumbo Lizards

Komodo dragons are special.
They are very strong reptiles.
They are the biggest lizards
in the world.

A Komodo dragon hunts for its next meal.

Glossary

- attack** (v.) to act in a harmful way toward another (p. 12)
- burrows** (n.) holes dug in the ground by an animal for use as homes (p. 10)
- hatch** (v.) to break open, as when a bird breaks out of an egg (p. 13)
- hunters** (n.) people or other animals that get food by killing other animals (p. 5)
- plates** (n.) hard, often flat body parts that cover an animal's body and protect it from harm (p. 7)
- reptiles** (n.) cold-blooded animals that have backbones and are covered with scales or plates (p. 4)

Connections

Writing and Art

Draw a picture of a Komodo dragon, labeling four important features on its body.

Science

Choose another reptile.
Compare its size to the Komodo dragon. Draw a picture of both, showing their size difference.
